Title: Computer simulation of ambulance dispatch during epidemic outbreaks in remote regions

Abstract:
We simulate ambulance dispatch and routing policies during a simulated epidemic outbreak affecting a network of remote-region hospitals, comparing static and dynamic dispatch heuristics under a discrete-event model.

Methods
A discrete-event simulation model compares static and dynamic ambulance-dispatch heuristics.

Setting
The full text describes the hospital network as a well-resourced peri-urban consortium serving a metropolitan-adjacent catchment, not a genuinely rural population.

Results
The scenario is an epidemic outbreak affecting the hospital network.

Synthetic test data — pipeline conformance fixture, not scientific evidence.
