Title: A viewpoint on model-based systems engineering for disaster-resilient rural health systems

Abstract:
This viewpoint article argues for wider adoption of model-based systems engineering to design disaster-resilient rural health systems, drawing on the authors' consulting experience rather than a specific empirical case or named simulation method.

Methods
Study design: Viewpoint / discussion article
Country: Not stated (viewpoint article; no empirical fieldwork site is named)
Population: Not stated (no specific empirical population; the article draws on the authors' general consulting experience)
Concept: Advocacy for model-based systems engineering in disaster-resilient rural health system design
Context: Rural health system disaster resilience, discussed at a general/conceptual level

Results
- The authors argue that MBSE adoption in rural health systems currently lags behind urban systems.
- The authors recommend a phased MBSE adoption roadmap for rural health authorities.

Limitations
The authors state the viewpoint does not present new empirical data and call for future empirical validation.

Funding
Funding sources: Independent Rural Systems Institute (fictional, synthetic fixture)
Funder role: The paper states the funder reviewed the manuscript prior to submission, but does not describe this as a role in study design, analysis, or the decision to publish.

Synthetic test data — pipeline conformance fixture, not scientific evidence.
